

Counterfactual generation with DiCE, per persisted fold model

Applied independently to each of the four persisted fold models (Section 3.1.6) — not four separate analyses, four applications of the same procedure

Feature suitability screen applied before step 2 (Table: Feature Suitability as Counterfactuals):

Suitable → INSULIN, HBA1C, HPN, DSLPDMIA

Conditional → PAOD, CKD (partially modifiable)

Unsuitable → SEX, AGE, SUBJ, DM_DUR, GBS, neurological exam, MNSI, Sudoscan (immutable or not directly actionable)

Neither check is guaranteed to succeed within its iteration budget even when a valid counterfactual exists;
the Discussion reports how many of the candidate instances yielded a usable result under this procedure.
