

# Modelling pipeline for DPN pre-screening and counterfactual explanation

Five stages, each driven by its own module/experiments/\*.yaml configuration and implemented as a standalone module/\*report.py script

Every arrow denotes a persisted artefact consumed by the next stage: the selected model/feature set (2 → 3), and the first repeat's four fold-specific models, thresholds and splits (3 → 4, 3 → 5). No stage refits against, or selects a threshold from, another stage's held-out test data.
